**CORTICOTROPIN RELEASING FACTOR ANTAGONISTS****Background Of The Invention**

This invention relates to pyridines, pyrimidines, purinones, pyrrolopyrimidinones and pyrrolopyridinones, processes for preparing them, pharmaceutical compositions containing them, and methods of using them to treat certain central nervous system (CNS) and other disorders.

CRF antagonists are mentioned in U.S. Patents 4,605,642 and 5,063,245 referring to peptides and pyrazolinones, respectively. The importance of CRF antagonists is set out in the literature, e.g., as discussed in U.S. Patent 5,063,245, which is incorporated herein by reference. A recent outline of the different activities possessed by CRF antagonists is found in M. J. Owens et al., Pharm. Rev., Vol. 43, pages 425 to 473 (1991), also incorporated herein by reference. Based on the research described in these two and other references, CRF antagonists are effective in the treatment of a wide range of stress-related illnesses, such as depression, anxiety, headache, irritable bowel syndrome, inflammatory diseases, immune suppression, Alzheimer's disease, gastrointestinal diseases, anorexia nervosa, hemorrhagic stress, drug and alcohol withdrawal symptoms, drug addiction, infertility, head trauma, stroke, and stress-induced infections in humans and animals.

- 10 wherein  $R_4$ ,  $R_7$  and  $R_{19}$  are defined as above, with a compound of the formula  $R_5OH$  or  $R_5SH$ , wherein  $R_5$  is defined as above, in the presence of a base.

#### Detailed Description of the Invention

- Methods of preparing the compounds and compositions of this invention are described below. In the discussion and reaction schemes that follow,  $R_1$  through  $R_9$ ,  $R_{11}$ ,  $R_{12}$ ,  $R_{16}$ ,  $R_{17}$ ,  $R_{19}$ , A, B, G, the dashed lines and structural formulae I, II, III, X, XI, XII and IV, unless otherwise indicated, are defined as above.

Whenever reference is made herein to  $C_1$ - $C_6$  alkyl, a straight or branched chain alkyl of one to six carbon atoms is meant, such as methyl, ethyl, isopropyl, t-butyl or hexyl.

- 20 Whenever  $R_2$  or  $R_5$  is a heterocyclic group, attachment of the group is through a carbon atom.

Whenever reference is made herein to  $C_1$ - $C_4$  alkyl or  $C_1$ - $C_6$  alkyl which "may contain one double or triple bond" in the definitions of  $R_1$ ,  $R_2$  and  $R_3$ , it is understood that at least two carbons are present in the alkyl for one double or triple bond.

- 25 Whenever reference is made herein to halo or halogen, fluoro, chloro, bromo or iodo is meant unless indicated otherwise.

- Compounds of the formula I wherein B is  $-NR_1R_2$ ,  $-NHCHR_1R_2$ ,  $-OCHR_1R_2$  or  $-SCHR_1R_2$ , and  $R_3$  is methyl, ethyl or chloro (hereinafter  $R_{19}$ ) may be prepared by reaction of a compound of the formula IV wherein D is Cl, and A,  $R_4$ ,  $R_5$ , and Z are as defined above with reference to formula I, with a compound of the formula BH wherein B is as defined immediately above. The reaction is carried out in a solvent in the presence of a base at a temperature of between about  $0^\circ$  to about  $230^\circ C$ . Suitable solvents are organic solvents such as tetrahydrofuran (THF), acetonitrile,

dimethylsulfoxide (DMSO), acetone, C<sub>2</sub>-C<sub>15</sub> alkyl alcohol, chloroform (CHCl<sub>3</sub>), benzene, xylene, toluene, sulfolane, pyridine, quinoline, 2,4,6-trimethylpyridine, acetamide, di-(C<sub>1</sub>-C<sub>2</sub>)alkylacetamide or 1-methyl-2-pyrrolidinone.

A preferred method of preparing compounds of the formula I wherein A is -CR<sub>2</sub>,  
 5 and B is -NR<sub>1</sub>R<sub>2</sub> or -NHCHR<sub>1</sub>R<sub>2</sub> is the two step procedure described below. First, a compound of the formula IV is reacted with an excess of R<sub>1</sub>NH<sub>2</sub> or NH<sub>3</sub> or an equivalent NH<sub>3</sub> precursor (e.g., NaN<sub>3</sub>, nBu<sub>4</sub>N<sup>+</sup>N<sub>3</sub><sup>-</sup> or NH<sub>2</sub>OH) at temperature from about 75°C to about 250°C and at a pressure from about 0 to about 300 psi, in an appropriate solvent, as described above, to form a compound of the formula I wherein B is -NHR<sub>1</sub>,  
 10 -NH<sub>2</sub>, -NH<sub>2</sub>OH or -N<sub>3</sub>. Compounds of the formula I wherein B is -N<sub>3</sub> or -NH<sub>2</sub>OH can be converted into the corresponding compounds of formula I wherein B is -NH<sub>2</sub> by methods well known in the art such as hydrogenation or reduction. Alkylation of a compound of the formula I wherein B is -NHR<sub>1</sub> or -NH<sub>2</sub> with an appropriate alkyl halide in the presence of an appropriate base such as lithium or sodium bistrimethylsilylamide,  
 15 lithium or sodium diisopropylamide, n-butyllithium or potassium t-butoxide, in an appropriate solvent such as THF, dioxane or methylene chloride, will yield the corresponding compound of formula I wherein B is -NR<sub>1</sub>R<sub>2</sub>. Alternatively, reductive amination of a compound of the formula I wherein B is -NHR<sub>1</sub> or -NH<sub>2</sub>, for example, acylation, followed by reduction with a borohydride (e.g., sodium borohydride) will form  
 20 the corresponding compound of formula I wherein B is -NR<sub>1</sub>R<sub>2</sub> or NHCHR<sub>1</sub>R<sub>2</sub>.

When B is -NR<sub>1</sub>R<sub>2</sub> or -NHCHR<sub>1</sub>R<sub>2</sub>, an excess of BH may be used both as a reagent and as a base. Bases other than BH such as potassium carbonate, tri-(C<sub>1</sub>-C<sub>6</sub>)alkylamine or sodium hydride may also be used. The reaction is carried out at a temperature of about 75° to 230°C. When the reaction is carried out in the presence  
 25 of a base, such as sodium hydride, potassium C<sub>1</sub>-C<sub>4</sub> alkoxide, or an organolithium compound such as n-butyllithium, a molar equivalent of the amine is used.

When B is -OCHR<sub>1</sub>R<sub>2</sub> or -SCHR<sub>1</sub>R<sub>2</sub>, a base which is capable of deprotonating BH may be used, such as an alkali metal hydride such as sodium or potassium hydride, or an organometallic base such as sodium diisopropylamide, sodium  
 30 bis(trimethylsilyl)amide, lithium diisopropylamide, lithiumbis(trimethylsilyl)amide, sodium or potassium C<sub>1</sub>-C<sub>4</sub> alkoxide, or n-butyllithium. The solvent used can be, for example, tetrahydrofuran, acetonitrile, dimethylsulfoxide, acetone, methylene chloride, toluene, a C<sub>2</sub>-C<sub>5</sub> alcohol, chloroform, benzene, xylene, or 1-methyl-2-pyrrolidinone, and the

Further reaction of the compound of formula IA with a Grignard reagent containing R<sub>1</sub> as defined above provides the compound of formula IB. Corresponding compounds of formula IC wherein B' is -CR<sub>1</sub>R<sub>2</sub>R<sub>11</sub>, or -C(=CR<sub>2</sub>R<sub>12</sub>)R<sub>1</sub> may be prepared by conventional methods. Thus, reaction of IB with an acid, such as concentrated sulfuric acid in acetic acid, or Burgess inner salt, such as (carboxysulfamoyl)triethylammonium hydroxide methyl ester, gives a compound of formula IC wherein B' is -C(=CR<sub>2</sub>R<sub>12</sub>)R<sub>1</sub>. Hydrogenation of a compound wherein B' is -C(=CR<sub>2</sub>R<sub>12</sub>)R<sub>1</sub> using a palladium/carbon (Pd/C) or platinum dioxide catalyst gives a compound IC wherein B' is CHR<sub>1</sub>R<sub>2</sub>. Compounds of the formula VII wherein  $R_4$  and  $R_6$  are each hydrogen and Y is N may be prepared by heating compounds of formula IVB with an acid catalyst in a suitable solvent such as toluene, benzene, t-butanol, acetonitrile and acetone, preferably toluene. The acid catalyst may be sulfuric acid, hydrochloric acid, p-toluene sulfonic acid, or methanesulfonic acid, preferably p-toluene sulfonic acid.

When Y in formula IVB is CH or N, a base may be used to deprotonate the proton of the compound of formula IVB. Suitable solvents are tetrahydrofuran, toluene, and methylene chloride, suitable reaction temperatures are between about  $-78^{\circ}\text{C}$  and  $100^{\circ}\text{C}$ , preferably  $-78^{\circ}$  to  $50^{\circ}\text{C}$ , and suitable bases are sodium hydride, potassium hydride, potassium t-butoxide, lithium bis(trimethylsilyl) amide, and lithium or sodium diisopropylamide.

Compounds of the formula VII wherein  $R_4$  and  $R_6$  are each hydrogen may be deprotonated with a base such as sodium hydride, or an organometallic compound such as lithium bis(trimethylsilyl)amide followed by quenching with an electrophile compound containing the group  $R_4$ , such as  $R_4\text{L}$  wherein L is a leaving group such as iodo, bromo, mesylate, tosylate or with p-tolyl-N-fluoro-N-( $\text{C}_1\text{-C}_6$  alkyl) sulfonamide, iodine, p-nitrobenzene, dimethylformamide, di( $\text{C}_1\text{-C}_4$  alkyl)ketone, formaldehyde, ( $\text{C}_1\text{-C}_4$  alkyl) aldehyde or bromine, to provide a compound of formula VII wherein  $R_4$  is fluoro, chloro, bromo, iodo, hydroxy,  $\text{C}_1\text{-C}_4$  alkyl,  $\text{S}(\text{C}_1\text{-C}_4$  alkyl),  $\text{CHO}$ ,  $\text{CH}(\text{OH})(\text{C}_1\text{-C}_4$  alkyl),  $\text{C}(\text{OH})(\text{di-}\text{C}_1\text{-C}_4$  alkyl) or  $\text{CH}_2\text{OH}$ . Further conventional alkylation of the hydroxy group or oxidation of the thioalkyl group leads to compounds of formula VII wherein  $R_4$  is  $\text{C}_1\text{-C}_4$  alkoxy and  $\text{SO}_n(\text{C}_1\text{-C}_4$  alkyl) wherein n is 1 or 2, respectively. Oxidation of compounds of formula VII wherein  $R_4$  is hydroxy and  $R_6$  is hydrogen affords corresponding compounds wherein  $\text{CR}_4\text{R}_6$  is  $\text{C}=\text{O}$ , which on reductive amination with an appropriate amine convert into corresponding compounds wherein  $R_4$  is amino. The compounds of formula VII wherein  $R_4$  is nitro or amino may be formed by reacting compounds of formula VII wherein  $R_4$  and  $R_6$  are both hydrogen with alkyl nitrite to form compounds wherein  $\text{CR}_4\text{R}_6$  is  $\text{C}=\text{NOH}$  and oxidizing or reducing to give the compounds of formula VII wherein  $R_4$  is nitro or amine, respectively.

The same reduction leads to compounds wherein  $R_{16}$  is hydrogen and  $R_{17}$  is hydroxy,

when both of  $R_4$  and  $R_6$  are not hydrogen. Alkylation of  $R_{17}$  is hydroxy with  $C_1-C_4$  alkyl iodide in the presence of sodium hydride gives the corresponding compound wherein  $R_{17}$  is  $O(C_1-C_4 \text{ alkyl})$ . When  $R_4$  is an electron withdrawing group such as a  $\text{NO}_2$ ,  $-\text{COO}(\text{C}_1\text{-C}_4 \text{ alkyl})$ ,  
5  $-\text{COOH}$ ,  $\text{CN}$  or  $-\text{CO}(\text{C}_1\text{-C}_4)\text{alkyl}$ , the reaction order for the coupling reactions that introduce the B and  $\text{ZR}_5$  groups in the synthesis of compounds of formula I may be reversed. The B group may be introduced before the  $\text{ZR}_5$  coupling step using the methods analogous to those described above. For example, compounds of the formula I wherein  $R_4$  is an electron deficient group may be prepared by reacting a  
10 compound of the formula XII with a compound of the formula  $\text{HZR}_5$ . Compounds of the formula XII may be prepared by reacting a compound of the formula V wherein A is  $\text{CR}_7$  and  $\text{R}_{13}$  and  $\text{R}_4$  are defined as above with a compound of the formula  $\text{B}''\text{H}$  in the presence of a base.

Compounds of the formula IV wherein D is chloro and Z is  $-\text{N}(\text{C}_1\text{-C}_4 \text{ alkyl})$  may  
15 be prepared by reacting the corresponding compounds wherein Z is  $\text{NH}$  with a base, at a temperature from about -78°C to about 100°C, preferably from about 0°C to about room temperature, followed by quenching with  $\text{C}_1\text{-C}_4$  alkyl iodide or bromide. Suitable bases include, for example, sodium hydride, lithium or sodium bis(trimethylsilyl)amide, lithium or sodium dialkylamide, and n-butyllithium. Suitable solvents include, for  
20 example, tetrahydrofuran, dimethylsulfoxide, toluene, benzene or methylene chloride.

Compounds of the formula IV wherein D is chloro, hydroxy or OP wherein P is a standard protecting group for hydroxy and Z is  $-\text{CR}_{13}\text{R}_{14}$  may be prepared by alkylation, using an  $\text{R}_{13}$  containing alkylating agent such as  $\text{R}_{13}\text{I}$ , compounds of the formula IV wherein Z is  $-\text{CHR}_{21}$  in the presence of a base that is capable of  
25 deprotonating the proton in the Z group, as mentioned above, followed by quenching with an  $\text{R}_{14}$  containing alkylating agent such as  $\text{R}_{14}\text{I}$ . Heating compounds of the formula IV wherein D is chloro or hydrogen and Z is  $-\text{CH}(\text{CN})$  in about 85% phosphoric acid at about the reflux temperature yields the corresponding compounds of formula IV wherein D is hydroxy and Z is  $\text{CH}_2$ . Deprotonation of the compounds of formula IV  
30 wherein Z is  $\text{CH}_2$  with a base, such as described above for deprotonation of  $\text{R}_5\text{ZH}$ , followed by quenching with a suitable electrophile such as a  $(\text{C}_1\text{-C}_6 \text{ alkyl})\text{iodide}$ , iodine, bromine, acetylchloride, formaldehyde, acetone, p-tolyl-N-fluoro-N- $(\text{C}_1\text{-C}_6 \text{ alkyl})\text{sulfonamide}$ , nitrobenzene,  $\text{C}_1\text{-C}_6$  alkyl nitrite, ethylene oxide or dihaloethane yields

the corresponding compounds of formula IV where in Z is  $-\text{CHR}_{13}$ ,  $-\text{CH}(\text{OH})$ , cyclopropyl or  $-\text{C}(\text{NOH})$ . Further alkylation of compounds wherein Z is  $-\text{CHR}_{13}$ , e.g., as described immediately above, with an alkylating agent of the formula  $\text{R}_{14}\text{I}$ , produces the corresponding compounds wherein Z is  $-\text{C}(\text{R}_{13}\text{R}_{14})$ .

5 Conversion of  $-\text{C}(\text{R}_5)\text{NOH}$  or  $-\text{CH}(\text{OH})\text{R}_5$  to  $\text{C}(\text{O})\text{R}_5$  may be accomplished by known methods. Hydrogenation or reduction of compounds wherein Z is  $-\text{C}=\text{NOH}$  provides compounds wherein Z is  $-\text{CHNH}_2$ . Some of the intermediates may require a protecting or deprotecting procedure to control the reaction selectivity using standard organic chemistry.

Conventional concentration or crystallization techniques can be employed to isolate the salts. Illustrative of suitable acids are acetic, lactic, succinic, maleic, tartaric, citric, gluconic, ascorbic, benzoic, cinnamic, fumaric, sulfuric, phosphoric, hydrochloric, hydrobromic, hydroiodic, sulfamic, sulfonic acids such as methanesulfonic, benzene sulfonic, p-toluenesulfonic, and related acids.

The active compounds of this invention may be administered alone or in combination with pharmaceutically acceptable carriers, in either single or multiple doses. Suitable pharmaceutical carriers include inert solid diluents or fillers, sterile aqueous solutions and various organic solvents. The pharmaceutical compositions formed by combining the novel compounds of formulae I, II and III and their pharmaceutically acceptable carriers can then be readily administered in a variety of dosage forms such as tablets, powders, lozenges, syrups, injectable solutions and the like. These pharmaceutical compositions can, if desired, contain additional ingredients such as flavorings, binders, excipients and the like. Thus, for purposes of oral administration, tablets containing various excipients such as sodium citrate, calcium carbonate and calcium phosphate may be employed along with various disintegrants such as starch, methylcellulose, alginic acid and certain complex silicates, together with binding agents such as polyvinylpyrrolidone, sucrose, gelatin and acacia. Additionally, lubricating agents such as magnesium stearate, sodium lauryl sulfate and talc are often useful for tableting purposes. Preferred materials for this include lactose or milk sugar and high molecular weight polyethylene glycols. When aqueous suspensions or elixirs are desired for oral administration, the essential active ingredient therein may be combined with various sweetening or flavoring agents, coloring matter or dyes and, if desired, emulsifying or suspending agents, together with diluents such as water, ethanol, propylene glycol, glycerin and combinations thereof.

For parenteral administration, solutions containing an active compound of this invention or a pharmaceutically acceptable salt thereof in sesame or peanut oil, aqueous propylene glycol, or in sterile aqueous solution may be employed. Such aqueous solutions should be suitably buffered if necessary and the liquid diluent first  
5 rendered isotonic with sufficient saline or glucose. These particular aqueous solutions are especially suitable for intravenous, intramuscular, subcutaneous and intraperitoneal administration. The sterile aqueous media employed are all readily available by standard techniques known to those skilled in the art.

The effective dosages for compounds of the formulae I, II or III and their salts

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/IB 95/00439

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claim 14 is directed to a method of treatment of (diagnostic method practised on) the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:  
Claims 17 and 18 could not be searched, because not all substituents were defined (Art. 6 - PCT).  
Claims not searched: 17 and 18
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
